

Supplementary document 1. Published site records (populations) of caudate species from Germany in which *Bsal* was detected until 2018. Data mostly summarized from SPITZEN-VAN DER SLUIJS et al. (2016), DALBECK et al. (2018), LÖTTERS et al. (2018), SCHULZ et al. (2018) and WAGNER et al. (2019a). In addition, new findings from the ongoing laboratory testing (especially quality assurance) of samples collected in same time frame were also included, so that some entries differ from those in the mentioned articles. Specimens tested positive for *Bd/Bsal* and negative for only *Bd* are indicated under remarks. Legend: † = dead specimen(s); + = ‘low’ infection load (1–10 GE); ++ = ‘medium’ infection load (> 10–100 GE); +++ = ‘high’ infection load (> 100 GE); CI = credible interval per year.

Supplementary document 6. Methods used to build *Bsal* species distribution models

Data

Grid-based correlative species distribution models, SDMs (FRANKLIN 2010, HUI et al. 2018), were created to study the global suitability to *Bsal*. SDMs are based on ecological information at species presences and calculate an ‘idealized’ niche (in environmental space) which is then projected into geographic space. To catch as much as possible of *Bsal*’s niche, we used both invasive and native records (cf. RÖDDER & LÖTTERS 2009). We employed most of the records known to date, in total 103 (30 of which native), accounting for the *Bsal* distribution in Belgium, China, Germany, Japan, the Netherlands, Spain, Taiwan, Thailand and Vietnam. Records were adopted from FELDMEIER et al. (2016) BEUKEMA et al. (2018), DALBECK et al. (2018), LÖTTERS et al. (2018), MARTEL et al. (2020), and, in addition, new records published in this paper were used:

The full list of records included the following coordinates (longitude, latitude in decimal degree): 99.05, 19.87; 105.05, 20.92; 105.04, 20.94; 106.73, 21.18; 106.66, 21.18; 105.72, 21.2; 105.65, 21.46; 104.35, 21.96; 104.26, 22; 105.81, 22.29; 105.73, 22.37; 104.42, 22.54; 114.2, 22.6; 105.87, 22.62; 104.87, 23.03; 104.85, 23.04; 121.28, 24.15; 121.29, 24.16; 121.31, 24.19; 127.77, 26.14; 127.8, 26.18; 128.03, 26.54; 128.24, 26.75; 119.61, 27.72; 129.3, 28.27; 129.5, 28.34; 135.43,

33.79; 139.39, 37.02; 144.41, 43.02; 144.28, 43.08; 6.41785, 50.039536; 6.420525, 50.045956; 6.439868, 50.079225; 4.89, 50.22; 6.36817, 50.241592; 6.344899, 50.252272; 6.338861, 50.259879; 6.522695, 50.268734; 6.1, 50.45; 6.279463, 50.570422; 6.400809, 50.574792; 5.59, 50.58; 6.431283, 50.614152; 6.09, 50.63; 6.185149, 50.65692; 6.358669, 50.664551; 6.423461, 50.682277; 6.27, 50.7; 6.270363, 50.702002; 6.345602, 50.717221; 6.32233, 50.726267; 6.361194, 50.736297; 6.301953, 50.739019; 6.36933, 50.744405; 6.232294, 50.745694; 5.95, 50.77; 5.97, 50.85; 5.75, 50.88; 6.08, 50.9; 5.74, 50.91; 6.02, 50.94; 5.99, 50.98; 6.298502, 51.049452; 5.92, 51.07; 4.51, 51.09; 7.05, 51.41; 6.97, 51.43; 7.26, 51.44; 7.27, 51.44; 7.14, 51.44; 5.92, 51.82; 2.499264, 41.554996; 7.266148, 51.442199; 7.139507, 51.435073; 7.270582, 51.442880; 7.256134, 51.440284; 7.019866, 51.423689; 6.968945, 51.431025; 6.423373, 50.682388; 6.232078, 50.746724; 6.204713, 50.770778; 6.307838, 50.754140; 6.366387, 50.747069; 6.366387, 50.747069; 6.359651, 50.735089; 6.413199, 50.737227; 6.366980, 50.237990; 6.328830, 50.215607; 6.658375, 50.209914; 7.257333, 51.437; 7.048501, 51.436599; 6.995988, 51.403281; 6.968945, 51.431025; 6.972078, 51.382679; 7.033296, 51.423306; 7.033296, 51.423306; 6.973143, 51.404382; 6.833334, 51.375838; 6.856205, 51.401709; 7.126877, 51.401582; 7.171701, 51.326008; 7.387315, 51.429405; 7.142683, 51.337388.

As ecological predictors we used current high resolution climate data for the period 1979-2013 at grid resolution 30 arc sec from the CHELSA version 1.2 database (KARGER et al. 2017), data available at: <http://chelsa-climate.org/>). Although most *Bsal* records originate from the period 2010-2019, we decided to use CHELSA data, as we consider them the best available global predictors. CHELSA operates on monthly means and is based on a quasi-mechanistic statistical downscaling of the ERA interim global circulation model (GCM) with a GPCC bias correction (KARGER et al. 2017). The CHELSA website provides 19 so called ‘bioclim’ variables (cf. BOOTH et al. 2014): Bio1 = Annual Mean Temperature, Bio2 = Mean Diurnal Range, Bio3 = Isothermality, Bio4 = Temperature Seasonality, Bio5 = Max Temperature of Warmest Month, Bio6 = Min Temperature of Coldest Month, Bio7 = Temperature Annual Range, Bio8 = Mean Temperature of Wettest Quarter, Bio9 = Mean Temperature of Driest Quarter, Bio10 = Mean Temperature of Warmest Quarter, Bio11 = Mean Temperature of Coldest Quarter, Bio12 = Annual Precipitation, Bio13 = Precipitation of Wettest Month, Bio14 = Precipitation of Driest Month, Bio15 = Precipitation Seasonality, Bio16 = Precipitation of Wettest Quarter, Bio17 = Precipitation of Driest Quarter, Bio18 = Precipitation of Warmest Quarter, Bio19 = Precipitation of Coldest Quarter.

These variables provide information independent of latitudinal variation and therefore are more useful in modelling than monthly values. As variable choice is one crucial aspect when generating SDMs, we computed SDMs with various bioclim variable combinations out of the 19 ones available: **(i)** Seven were selected via pair-wise Pearson correlation analyses to avoid effects

of multicollinearity, which is important when projecting SDMs into new space (DORMANN et al. 2013). Of highly correlated variables ($|r| > 0.7$), we excluded the less informative one, based on a priori assumptions on biological importance (cf. MARTEL et al. 2013) to our target organisms: Bio1, Bio2, Bio10, Bio13, Bio14, Bio18, Bio19. In accordance with previous published *Bsal* SDMs, we also ran predictor sets incorporating **(ii)** Bio8, Bio10, Bio11, Bio15, Bio16, Bio17 (cf. FELDMEIER et al. 2016), **(iii)** Bio3, Bio4, Bio5, Bio6, Bio15, Bio16, Bio17 (cf. BEUKEMA et al. 2018) and **(iv)** Bio2, Bio5, Bio7, Bio15, Bio18, Bio19 (cf. BASANTA et al. 2018).

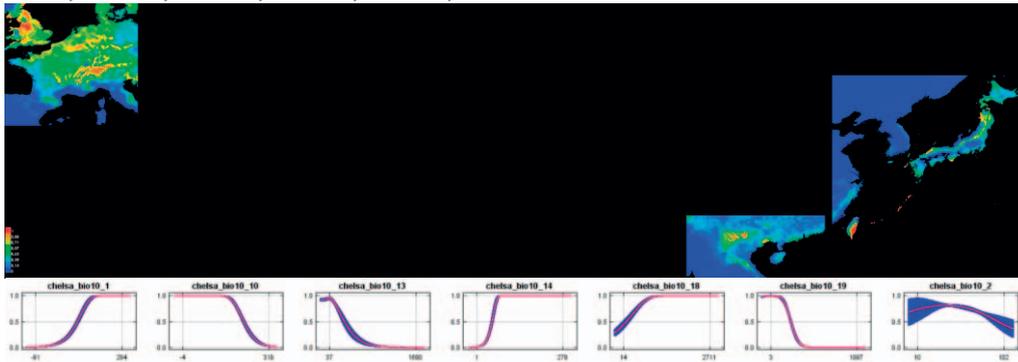

Modelling

Maxent 3.4.1 (https://biodiversityinformatics.amnh.org/open_source/maxent/) was used for SDM building (PHILLIPS et al. 2006, 2017). This presence-only/background method operates with a machine-learning algorithm following the principle of maximum entropy. It makes predictions on the potential geographic range of a taxon by taking environmental (here: climatic) data from georeferenced species records and random background data (PHILLIPS et al. 2006, YACKULIC et al. 2013). In this way, it contrasts the environmental conditions at species' presences against those at the background to fit a function to estimate the relative suitability to the species (MEROW et al. 2013). Maxent is a widely used SDM tool and often performs better than other SDM methods (ELITH et al. 2006, PHILLIPS & DUDÍK 2008). It offers various settings for SDM building allowing fine-tuning (cf. PHILLIPS et al. 2006, PHILLIPS & DUDÍK 2008). This requires some caution, however, as with them, the output can be dramatically altered when uncritically used (ELITH et al. 2010, 2011, MEROW et al. 2013, YACKULIC et al. 2013). Therefore, it is important to explore settings and to adapt them to the available data (PHILLIPS & DUDÍK 2008, WARTON & AARTS 2013, PHILLIPS et al. 2017).

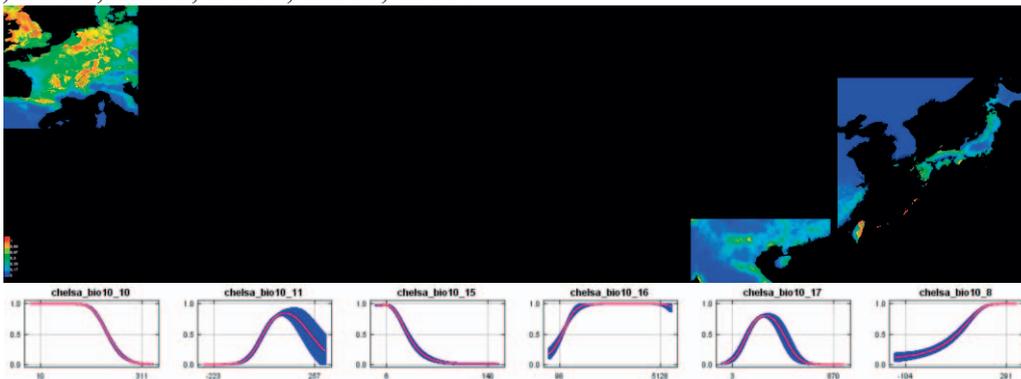

In our final model runs, we employed linear + quadratic + product (LQP) features under the subsample approach (100 replicates), with 25% of the records randomly set aside as test data. In response curve calculations, extrapolation was used and fading by clamping. Ample windows around *Bsal* presences in Asia and Europe were chosen as background (see below), while we projected models into Germany only. The number of background points was set to 100,000. All other Maxent settings were default, including the Cloglog output format (ranging 0-1) (PHILLIPS & DUDÍK 2008, SHCHEGLOVITOVA & ANDERSON 2013, PHILLIPS et al. 2017).

Below we show average model performance as Cloglog heat maps (standard deviation was ≤ 0.17 , not shown) and response curves (red, with the standard deviation each indicated in blue) for model runs (i) to (iv).

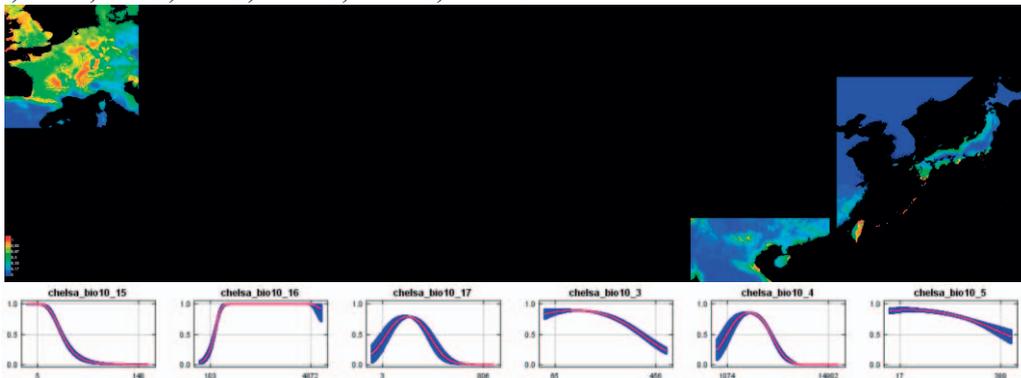

(i) Bio1, Bio2, Bio10, Bio13, Bio14, Bio18, Bio19

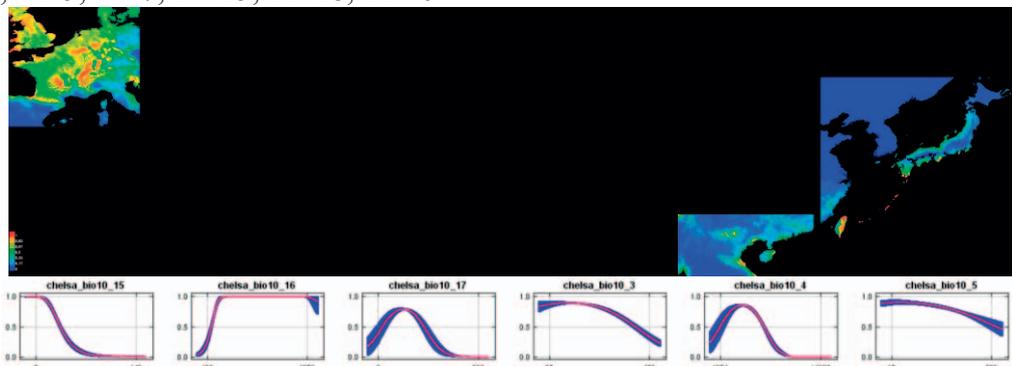

(ii) Bio8, Bio10, Bio11, Bio15, Bio16, Bio17

(iii) Bio3, Bio4, Bio5, Bio6, Bio15, Bio16, Bio17

(iv) Bio2, Bio5, Bio7, Bio15, Bio18, Bio19

Data processing and output maps

Maxent calculates the area under the receiver operating characteristic curve (AUC) as a measure of predictive accuracy (PHILLIPS et al. 2006). Following the classification of SWETS (1988), AUC values range between 0.5 for models with no predictive ability and 1.0 for models giving perfect predictions; values ≥ 0.91 describe ‘high’, ≥ 0.71 ‘moderate’, ≥ 0.5 ‘low’ model accuracy. Although criticized (e.g. YACKULIC et al. 2013), the AUC is informative as it mirrors the model’s ability to distinguish between species records and background points, i.e. showing how general or restricted a distribution is along the range of the variables in the studied region (MEROW et al. 2013). The mean AUC values in our approaches were (i) 0.903, (ii) 0.862, (iii) 0.876 and (iv) 0.904, thus suggesting high accuracy in model performance.

For processing the resulting SDM maps (see Fig. 5), DIVA-GIS 7.5.0 (HIJMANS et al. 2001) was chosen. We did not set any threshold delimitating potential presence versus absence (cf. PHILLIPS et al. 2017).
